AI Usage Disclosure

I used **Claude (Anthropic, Sonnet 5.5)**, in a Claude Code environment, to help draft all tasks. I reviewed the outputs and I can explain each decision in the interview.

Task	What AI did	How it was checked
T1 Week plan	Drafted the plan, decisions and dates from the assignment and my background.	Page limit checked by rendering the PDF; dates cross-checked with T5 and T6.
T2 Client communications	Drafted the email and call notes.	Word counts run by script (under 200 each).
T3 Ledger specification	Drafted rules, acceptance criteria and test data.	One page checked. **The specification was not run through Claude Code**, so the rules are untested in code.
T4 Change request	Drafted options and recommendation.	Effort and timeline figures are **indicative assumptions**, not a team estimate.
T5 Tracker (Excel)	Wrote the script that builds the workbook.	Formulas recalculated and colours checked in a rendered copy.
T6 Release plan	Drafted stages, test cases, rollback and incident steps.	Pass thresholds (for example 0 wrong amounts in 100 calls) are my proposals, not client-agreed.
T7 AI tool	Wrote the app, tests and README.	11 unit tests pass; app driven in headless Chrome (sample, upload, bad file, ZIP). **Not deployed. Not on GitHub until I push it.** One real AI error is recorded in the README.
T8 Video	Drafted the script and timings.	Spoken length estimated at 130 words per minute. **I record the video myself**, in my own words.

Assumptions I made

Monday = 9 Nov 2026. IP approval "3 working days" counts from the day the client receives the request. Sprints are 2 weeks, so Ledger go-live is about 4 weeks away. UAT needs about 2 working days. Sagar's "all customers" means customers who have given consent.
